

How to determine backup energy storage capacity of base stations?

For the determination of the backup energy storage capacity of base stations in different regions, this paper mainly considers three factors: power supply reliability of the grid node where the base station is located (grid node vulnerability), the load level of the grid node and communication load.

How do I choose a base station?

**Key Factors:** **Power Consumption:** Determine the base station's load (in watts). **Backup Duration:** Identify the required backup time (hours). **Battery Voltage:** Select the correct voltage based on system design. **Efficiency & Discharge Rate:** Consider battery efficiency and discharge characteristics.

What is the backup capacity of base stations under fixed backup time?

For the backup capacity of base stations under fixed backup time, this article assumes that the backup time of base stations at each node of the power grid is 3 h, and other parameters remain unchanged. The backup capacity results of each power grid node under the fixed backup time of the base station are shown in Fig. 23. Fig. 23.

Why do base stations have a small backup energy storage time?

Base stations' backup energy storage time is often related to the reliability of power supply between power grids. For areas with high power supply reliability, the backup energy storage time of base stations can be set smaller.
