

How does solar power work?

Solar power works by converting energy from the sun into power. There are two forms of energy generated from the sun for our use - electricity and heat. Both are generated through the use of solar panels, which range in size from residential rooftops to 'solar farms' stretching over acres of rural land. Is solar power a clean energy source?

How do solar panels generate electricity?

This process is constant. Over 500 million tons of hydrogen atoms are converted into helium every second, resulting in photons that generate solar energy here on Earth. In a nutshell, solar panels generate electricity when photons (those particles of sunlight we discussed before) hit solar cells. The process is called the photovoltaic effect.

How does a solar inverter work?

Solar inverters convert DC electricity into AC electricity, the electrical current appliances run on when plugged into a standard wall socket. Other types of solar technology include solar hot water and concentrated solar power. They both use the sun's energy but work differently than traditional solar panels.

How do we use solar energy?

There are two key ways of capturing and using this energy from the Sun: solar panels (photovoltaics), which convert light into electricity, and solar thermal power, which transforms the Sun's energy into heat.
